

## Graballo

### Applications in Telephony: Internet Dialup Access

In order to attend phone calls directed to busy telephones due to an internet connection, the call must be forwarded by the switch to **Graballo** equipment. **Graballo** will answer the call, record a message and send it as a wav file attached to an email.

#### Example:

1. **User** is using a dialup connection to internet.
2. During the internet connection somebody call **User** and the switch automatically forward the call to **Graballo**.
3. **Graballo** answer the call, record a message in a multimedia file (wav), then send it (\*) to **User** personal email. The message used by **Graballo** to answer the call can be recorded by **User** himself, for example *"Hello this is Jacques, I'm connected to the internet, leave me a message and I will receive it right now by email, bye"*. If the calling party hang up the phone and does not leave a message, **User** will receive an email containing the time and origin number.
4. **User** receive the email and listen the message through computer speaker.

(\*) **Graballo** may also work as web server and send a link to the audio file instead of sending an attached file.
